

FARM DASHBOARD - CORN

SUMMARY: Fields=55 | Avg Yield=211.3 bu/ac | Health Score=68.3 | Correlation=0.90 | NDVI=0.502 | Total Acres=8964

HIGH PRIORITY

- Medium vegetation health (23 fields) - consider foliar feeding or pest inspection
- Fair soil health (19 fields) - enhance organic matter, improve drainage
- Low organic matter detected (11 fields) - apply cover crops, manure, or compost
- Poor drainage conditions (24 fields) - consider drainage tiles or land grading

MEDIUM PRIORITY

- Soil compaction risk detected (9 fields) - consider deep tillage or cover crops
- Erosion risk identified (41 fields) - install terraces or cover crops

KEY FINDINGS

- Health-Yield Correlation: 0.90 (Strong positive relationship)
- Top performing fields (>=80th percentile): 12 fields
- Fields requiring attention: 19 fields

RECOMMENDATIONS

1. Conduct soil testing for nutrient levels and pH in low-performing areas
2. Apply organic amendments (compost, manure, cover crops) to low-OM fields
3. Implement drainage improvements for poorly drained fields
4. Establish erosion control measures (terraces, cover crops, buffer strips)
